The present sequence represents Tir, a novel translocated intimin receptor (formerly termed Hp90) from an enteropathogenic receptor (formerly termed Hp90) from an enteropathogenic schedular old (see Ax58868). Tir proteins are isolated tir polynucleotide (see Ax58868). Tir proteins are secreted by attaching and effacing pathogens such as EPBC and EHBC secreted by attaching and effacing pathogens such as EPBC and EHBC see Ax706221). E. coll. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin concleation. Diagnosis of disease caused by pathogenic E. coll can be performed by use of antibodies that bind to Tir to detect the protein or the use of antibodies that bind to Tir, and a kit for the detection of nucleic peptides, a recombinant method for producing recombinant Tir, and a kit for the detection of antibodies which bind to Tir, and a kit for the detection of suith Tir to induce a protective immune response is also provided. In addition, Tir fusion proteins can be used in attenuated E. coli conflowed a cell-mediated immune response to ther polypeptides, e.g. antigens. A method for screening for compounds which interfere with the binding of bacterial pathogens to their
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SSGIGYGLSSALIVAGGIGAGVTTALHRRNQPAEQTTTTTTTTTVVQQQTGGIPQHKVALM 420

The present sequence represents Tir, a novel translocated intimin receptor (formerly termed Hp90) from an enterohaemorrhagic receptor (formerly termed Hp90) from an enterohaemorrhagic receptor (formerly termed Hp90) from an enterohaemorrhagic secreted by attaching and effacing pathogens was deduced from an isolated tir polynucleotide (see AXSB859). Tir proteins are secreted by attaching and effacing pathogens such as EHBC and EPBC (see AXV6020) E. coli. The bacterial pathogens insert their own receptors into mammalian cell surfaces, to which the pathogen then adheres to trigger additional host signaling events and actin nucleation. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein or the use of nucleic acid probes for detection of nucleic acids antibodies which bind to Tir, and a kit for the detection of antibodies which bind to Tir, and a kit for the detection of antibodies which bind to Tir, and a kit for the detection of antibodies which bind to Tir, and a kit for the detection of antibodies a protective immune response is also provided. In addition, Tir fusion proteins can be used in attenuated E. coli and antigens. A method for screening for compounds which interfere with the binding of bacterial pathogens to their interfere provided.
New translocated intimin receptor useful for treating infection by enteropathogenic or enterohemorrhagic Escherichia coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "encoded by codon of 1 apparent nucleotide, causing frameshift in the DNA sequence"

The present invention describes a method of screening for an inhibitor of intimin binding to eukaryotic cells. The method comprises exposing an intimin polypeptide having a Tir-independent cell binding activity to test agents, and obtaining an inhibitor based on its ability to bind the cast agents, and obtaining an inhibitor based on its ability to bind the cast agents, and obtaining are used in the prevention, treatment and/or diagnosis of bacterial infections, preferably by enteropathic and/or enterohaemorrhagic Escherichia coll, Shiga toxigence E. coli, Hafnia caterior cause a histopathological effect known as attachment and effacement on intestinal epithelial cells. The inhibitors can be used to produce food supplements or additives, especially where the food is a milk substitute. The method can be used to sort cells based on their ability to bind to a Tir independent cell binding domain of an intimin polypeptide. Polypeptides having Tir-independent intimin binding activity can be used to produce a vaccine against a bacterial disease. The present sequence represents a specifically claimed intimin Creminal

                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New peptide(s) containing the core epitope of Moraxella catarrhalis Usp proteins - useful in, e.g. vaccines to prevent or treat M. catarrhalis infection, and antibodies for passive immunisation.
                                                         sequence represents the N-terminal sequence of Tir (see
                                                                   also AAY06220), a novel translocated intimin receptor from an enteropathogenic Escherichia coli (EPEC) strain. The 78 kDa EPEC protein is secreted by the bacterial pathogen. Diagnosis of disease caused by pathogenic E. coli can be performed by use of antibodies that bind to Tir to detect the protein, or the use of nucleic acid probes for detection of nucleic acids encoding Tir. Kit for the detection of Tir-producing E. coli is provided. Also protective immune response, and a method for screening for compounds which interfere with the binding of bacterial pathogens
  \mathbf{p}_{\mathbf{\lambda}}
  New translocated intimin receptor useful for treating infection enteropathogenic or enterohemorrhagic Escherichia coli
                                                                                                                                                                                                                                                                           .;

treat infections such as otitis media, sinusitis, lower respiratory tract infections such as otitis media, sinusitis, lower respiratory tract infections. They can also be used as immunity enhancers for other bacterial, parasitic or viral antigens, to raise antibodies and as immunoassay reagents for detecting specific antibodies. The antibodies are useful for passive immunisation and as immunoassay reagents. Detection of the epitopic core sequence, by immunoassay or by FCR, is used to odiagnose infection. The Usp antigens encoding nucleic acid sequences are also used to produce recombinant proteins and for screening for potential anti-M. catarrhalis agents, while their fragments are useful as diagnostic probes or primers or to isolate variant sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | ; | :||:|| | 496 ssdiktlknnveeglldlsgrliddkadiaknqadiaqnqtdiqdlaaynelqdqyaqkq 555

The present sequence represents a Haemophilus influenzae adhesin

(Hia) protein from the type c Haemophilus influenzae strain API:

Hia genes and proteins have antiinflammatory, auditory and antibacterial

activities, and can be used in the production of a vaccine. An

immunogenic composition comprising an Hia gene, a polypeptide encoded

by an Hia gene, or a recombinant Hia polypeptide is useful for inducing

crotection against disease caused by Haemophilus strains in a

susceptible host, preferably a human. An Hia protein is useful as an

antigen, in immunogenic preparations including vaccines, as a carrier

for other lumunogens, and in the generation of diagnostic reagents. Hia

is useful for treating diseases caused by the infection of Haemophilus

influenzae such as meningitis, epiglottitis, septicaemia and otitis

media. Recombinant production of Hia favours high recovery of the

protein compared to the low recovery of native protein from Haemophilus

influenzae species. A truncated protein has a significantly higher

amount of recovery than a full-length protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             il nucleic acid encoding Hemophilus influenzae adhesin protein, for as antigens and vaccines and for treating Hemophilus influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1161 lggtangrndtgtvinkdgltitlangaaagtdasngntisvtkdgisagnkeitnvksa 1220

Its amino acid sequence was deduced from a genomic DNA clone (AAF41476) derived from Haemophilus influenzae type b strain C65. Large quantities of recombinant HA2 can be produced in transformed prokaryotic or eukaryotic host cells, for use in vaccines against

This invention describes a novel nucleic acid (I) which has antitumor activity. (I) encode proteins that interact with the Fanconi anemia protein of complementation group A, so may be part of the complex or signal transduction cascade which causes the defect responsible for Fanconi anemia. Polypeptides (II) encoded by (I) are used as immunogens
                                                                                                                                                                                                                                                                                                                                                                              proteins,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      3 Polypeptide sequences (AAW19629-30 and AAW00918) can be deduced frot the vep ORF1 polyketide synthase (PKS) gene cluster (AAF68715) of Streptomyces venezuelae. The sequence data indicate that the PKS sequence data indicate that the PKS contains 5 PKS modules. The vep gene cluster encodes a polyene of 12 carbons. The vep gene cluster domain. Bach of the sequenced modules includes a keto-ACP, an acyltransferase, a dehydratase, a keto-reductase and an acyl carrier protein domain. A novel expression cassette encoding the first module from the vep gene cluster and module 7 from the Streptomyces tylp gene cluster has polyhydroxyalkanoate (PHA) monomer synthase activity and can be used for PHA prodn. in host (esp. insect) cells for use as a biodegradable polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23 PSQTDGAARGGTGHLISST--GALGSRSLFSPLRNSMADSVD---SRDIPGLPTNPSRLA 77

Compositions comprising the protein, nucleic acid or antibody specific to the protein are useful as pharmaceuticals, e.g. a vaccine composition or a diagnostic composition. The composition is also useful for treating or preventing an infection due to Neisserial bacteria, especially Neisseria meningitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1235 -dvgksrrfigikvgksnysknelnetklpvrvvaqtaatrsgwdt-vlegtefkttlag 1292

The present sequence represents a Caulobacter S-layer protein used in an example of the present invention. A new DNA construct has been developed which contains at least one restriction site for insertion of DNA upstream of DNA encoding a C-terminal region of at least the last 82 amino acids (aa) of Caulobacter S-layer protein. Caulobacter containing the DNA constructs above additionally containing a sequence encoding a heterologous polypeptide, are particularly useful in live vaccines (where the heterologous polypeptide is an antigen). They can also be used for production of e.g. ligands, enzymes or other proteins, e.g. metallothioneins to remove heavy metals from water or sewage, or xylanase or cellulase for use in wood pulping. All known Caulobacter strains are harmless, and stable in outdoor environments, including water (so suitable for vaccinating fish) or soil. They are well suited for growing in biofilm reactors and produce S-layer proteins, which is an ideal system for presentation of antigens, at high level.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 132.5; DB 18; Length 1026; Pred. The patent discloses a method for cleaving a recombinant fusion protein which is produced by Caulobacter and consists of Caulobacters surface layer (S-layer) protein (containing the C-terminal secretion signal) and a target protein heterologous to Caulobacter. The cleavage of target protein from the S-layer protein is carried out under mild acid protein from the S-layer protein is carried out under mild acid protein so that cleavage occurs at aspartate.

The cleavage is accomplished while the fusion protein is in an insoluble aggregate form which facilitates purification of the protein. The method is useful for producing pure proteins including recombinant human and animal therapeutic antibiotic and vaccine peptides, enzymes, protein polymers, and antibacterial enzymes for foodstuffs.

The present sequence is a S-layer protein from C. crescentus.

The present secretion signal, corresponding to the C-terminal portion of the protein from amino acid 690 onwards, is fused with a target sequence the protein from amino acid 690 onwards, is fused with a target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            27;

pikromycin;

computating a desosamine blosynthetic gene cluster, a fragment or its biologically active variant, where the nucleic acid sequence is not derived from the eryC gene cluster of Saccharopolyspora erythraea or Streptomyces antibioticus. The invention also relates to a macrolide biosynthetic gene cluster encodes proteins which synthesise methymycin, plusynthetic gene cluster encodes proteins which synthesise methymycin, plusynthetic gene cluster encodes proteins which synthesise methymycin, plusynthycin, narbomycin or augmented cells comprising the desosamine and/or macrolide biosynthetic gene clusters are useful for the production of biologically active macrolides. The macrolide biosynthetic proteins are useful for synthesis of methymycin, plusynowin, neomethymycin and narbomycin. The alternative termination of polyketide polyhydroxyalkanoate (PHA) monomers. The compounds produced by the recombinant host cells are useful as biopolymers, e.g., in packaging or biologically active agents, such as chemotherapeutics, in packaging or biologically active agents, such as chemotherapeutics, in macrolide biowaris agents to treat asthma, chronic obstructive pulmonary chlestered. The place of the diseases involving respiratory inflammation, cholestered. The production of polyhydroxy agents or macrolide biowarish agents or macrolide biory inflammation. cholesterol-lowering agents or macrolide-based antibiotics which are active against a variety of organisms, e.g., bacteria, including multi-drug resistant pneumococci and other respiratory pathogens, as well as viral parasitic pathogens, or as crop protection agents (e.g., fungicides or insecticides) via expression of polyketides in plants. Sequences AAY77181-Y77189 and AAY77199 represent Streptomyces venezuelae ATCC 15439 protein sequences. These are encoded by a DNA sequence designated vep ORF I, which actually contains 3 open reading frames. The vep ORF I protein is defined in the specification as a PHA monomer invention relates to an isolated and purified nucleic acid segment

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

pulf 74E protein - fruit fly (Drosophila melanogaster)
Bulf protein - fruit fly (Drosophila melanogaster)
Bulf protein names: ecdysone-induced protein E74B; ets-related protein E74B
C;Species: Drosophila melanogaster
C;Species: Drosophila melanogaster
C;Date: 28-Feb-1990 #sequence_revision 28-Feb-1990 #text_change 21-Jul-2000
C;Accession: S04722; B34692 revision 28-Feb-1990 #text_change 21-Jul-2000
C;Accession: S04722; B34694, 1989
A;Title: Characterization of a putative transcription factor gene expressed
A;Reference number: S04722; MUID:89315191
A;Molecule type: DNA
A;Recassion: S04722
A;Molecule type: DNA

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
